This plugin provides support for binary data, which are lost with the MySQL Server 5.1.8. Transferring binary data is usually required if the data is large. Percona plugin. This plugin allows direct access to the Percona storage engine, through the MySQL Router console. Percona is an open source project for managing MySQL server. The other plugins described here are optional. They can be used to expand the functionality of MySQL Router. For instance, the replication plugin can be used with InnoDB tables in order to expand MySQL Router to support other MySQL features, such as master-master and master-slave replication. Additional Plugins for MySQL Router: There are a number of additional plugins provided. These include: Percona Plugin: It is an add-on that lets you access the Percona storage engine via the MySQL Router console. This plugin improves MySQL Router's support for the Percona cluster. Iwan's Storage Plugin: This is a plugin that makes an external configuration file be used to control MySQL Router. With it, you can create the file on Windows OS, and use it for creating MySQL Router databases on other operating systems. Online Help: This plugin helps in troubleshooting MySQL Router issues.
